OVERVIEW OF JOIN TYPES
Overview

• This will begin to build our understanding of the various JOIN types.
• This presentation is a resource for you in this lecture!
JOINS Overview

• As we learn about more types of JOINS it will become very useful to reference a JOINS Venn Diagram figure.

• These are very easy to find via a Google Image Search!
JOINS Overview

SQL JOINS

SELECT <select_list>
FROM TableA A
LEFT JOIN TableB B
ON A.Key = B.Key

SELECT <select_list>
FROM TableA A
INNER JOIN TableB B
ON A.Key = B.Key

SELECT <select_list>
FROM TableA A
LEFT JOIN TableB B
ON A.Key = B.Key
WHERE B.Key IS NULL

SELECT <select_list>
FROM TableA A
FULL OUTER JOIN TableB B
ON A.Key = B.Key
WHERE A.Key IS NULL OR B.Key IS NULL

SELECT <select_list>
FROM TableA A
RIGHT JOIN TableB B
ON A.Key = B.Key
JOINS Overview

• The example table for our discussion:

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>name</td>
</tr>
<tr>
<td>--</td>
<td>----</td>
</tr>
<tr>
<td>1</td>
<td>Pirate</td>
</tr>
<tr>
<td>2</td>
<td>Monkey</td>
</tr>
<tr>
<td>3</td>
<td>Ninja</td>
</tr>
<tr>
<td>4</td>
<td>Spaghetti</td>
</tr>
</tbody>
</table>

• Items in red are present in both tables.
**INNER JOIN**

Inner join produces only the set of records that match in both Table A and Table B.

**Original Tables**

<table>
<thead>
<tr>
<th>id</th>
<th>name</th>
<th>id</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Pirate</td>
<td>1</td>
<td>Rutabaga</td>
</tr>
<tr>
<td>2</td>
<td>Monkey</td>
<td>2</td>
<td>Pirate</td>
</tr>
<tr>
<td>3</td>
<td>Ninja</td>
<td>3</td>
<td>Darth Vader</td>
</tr>
<tr>
<td>4</td>
<td>Spaghetti</td>
<td>4</td>
<td>Ninja</td>
</tr>
</tbody>
</table>

**Example SQL Query**

```
SELECT * FROM TableA
INNER JOIN TableB
ON TableA.name = TableB.name
```
FULL OUTER JOIN

Full outer join produces the set of all records in Table A and Table B, with matching records from both sides where available. If there is no match, the missing side will contain null.

```
SELECT * FROM TableA
FULL OUTER JOIN TableB
ON TableA.name = TableB.name
```

<table>
<thead>
<tr>
<th>id</th>
<th>name</th>
<th>id</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Pirate</td>
<td>2</td>
<td>Pirate</td>
</tr>
<tr>
<td>2</td>
<td>Monkey</td>
<td>3</td>
<td>Ninja</td>
</tr>
<tr>
<td>3</td>
<td>Ninja</td>
<td>4</td>
<td>Spaghetti</td>
</tr>
<tr>
<td>4</td>
<td>Spaghetti</td>
<td>null</td>
<td>null</td>
</tr>
<tr>
<td>null</td>
<td>null</td>
<td>1</td>
<td>Rutabaga</td>
</tr>
<tr>
<td>null</td>
<td>null</td>
<td>3</td>
<td>Darth Vader</td>
</tr>
</tbody>
</table>
**LEFT OUTER JOIN**

Left outer join produces a complete set of records from Table A, with the matching records (where available) in Table B. If there is no match, the right side will contain null.

<table>
<thead>
<tr>
<th>id</th>
<th>name</th>
<th>id</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>--</td>
<td>--</td>
<td>--</td>
<td>--</td>
</tr>
<tr>
<td>1</td>
<td>Pirate</td>
<td>1</td>
<td>Rutabaga</td>
</tr>
<tr>
<td>2</td>
<td>Monkey</td>
<td>2</td>
<td>Pirate</td>
</tr>
<tr>
<td>3</td>
<td>Ninja</td>
<td>3</td>
<td>Darth Vader</td>
</tr>
<tr>
<td>4</td>
<td>Spaghetti</td>
<td>4</td>
<td>Ninja</td>
</tr>
</tbody>
</table>

```sql
SELECT * FROM TableA
LEFT OUTER JOIN TableB
ON TableA.name = TableB.name
```
LEFT OUTER JOIN with WHERE

To produce the set of records only in Table A, but not in Table B, we perform the same left outer join, then exclude the records we don't want from the right side via a where clause.

```
SELECT * FROM TableA
LEFT OUTER JOIN TableB
ON TableA.name = TableB.name
WHERE TableB.id IS null
```
To produce the set of records unique to Table A and Table B, we perform the same full outer join, then exclude the records we don't want from both sides via a where clause.

```
SELECT * FROM TableA
FULL OUTER JOIN TableB
ON TableA.name = TableB.name
WHERE TableA.id IS null
OR TableB.id IS null
```
Review

• We’ve learned about the various JOIN types
• The next lectures will focus on showing examples of these various JOIN types.
LEFT JOIN
LEFT JOIN Statement

• Suppose we have two tables: A and B.
LEFT JOIN Statement

• The data in the B table relates to the data in the A table via the fka field.
• Each row in the A table may have zero or many corresponding rows in the B table.
• Each row in the B table has one and only one corresponding row in the A table.
• If you want to select rows from the A table that have corresponding rows in the B table, you use the INNER JOIN clause.
LEFT JOIN Statement

SELECT A.pka, A.c1, B.pkb, B.c2
FROM A
LEFT JOIN B ON A.pka = B.fka;
LEFT JOIN Statement

• To join the A table to the B table, you need to:
  – Specify the columns from which you want to select data in the SELECT clause.
  – Specify the left table i.e., A table where you want to get all rows, in the FROM clause.
  – Specify the right table i.e., B table in the LEFT JOIN clause. In addition, specify the condition for joining two tables.
LEFT JOIN Statement

• The LEFT JOIN clause returns all rows in the left table ( A) that are combined with rows in the right table ( B) even though there is no corresponding rows in the right table ( B).

• The LEFT JOIN is also referred as LEFT OUTER JOIN.
LEFT JOIN Statement

• Let’s see an example of a LEFT JOIN!
